In several parts of western United States and in other areas of this world, there are erosional features and related deposits of debris which speak loudly of massive discharges of water. These include canyons 20 miles long, 6 miles wide, and many hundreds of feet thick. Debris consists of rolling hills and massive gravel bars high above the surrounding terrain. Much of the debris are boulders the size of automobiles and larger. These features support Noah's Flood and the aftermaths of that Flood. Geologist, Dave Nutting, takes you on a visual tour of some of these sites so that we can apply this knowledge to other locations including our own backyard. You may never go on a trip again without seeing the countryside in a different light!

Dave Nutting is the founder and director of Alpha Omega Institute. AOI is an organization with a mission to teach the scientific and Biblical evidence of creation and its relevance to children and adults throughout the world. Dave has been giving creation seminars at churches, universities, public and private schools for more than 20 years. His audiences range from young children to groups of medical students and doctors. Dave is a former evolutionist who "evolved" into a creationist after studying the scientific issues. Before establishing AOI, Dave taught in high schools and several colleges including Colorado State University, Mesa State College and Sheldon Jackson College. Dave holds degrees in mathematics and in geology. His presentations are noted for quality visuals and are easy to understand even for children.
