“Dinosaur Soft Tissue”

Northwestern College

3003 North Snelling, Roseville Minnesota,

Totino Fine Arts Center, Room F2128 (Old F116)

For Details Directions & Maps visit www.tccsa.tc

Recently, Mary Schweitzer and others have shocked the scientific community with their discovery of intact soft tissues (cells and flexible blood vessels) and preserved organic molecules inside bones from Tyrannosaurus Rex and Hydrosaur specimens. Others have discovered preserved muscle tissue in fossils and coprolites and have reported "bad odor" when digging up dinosaur remains.

These discoveries contradict current beliefs of the scientific community and have created a controversy - can soft tissue remain intact much longer than expected, or are these specimens not as old as expected? We will explore the evidence and its implications.
